JURNAL

Soal No 1:

a. Time-Series Database (contoh: InfluxDB atau TimescaleDB) atau Wide-Column Store (contoh: Apache Cassandra).

b. Alasan Teknis:

- Data Sensor IoT bersifat Sekuensial: Data suhu gudang dan stok masuk-keluar adalah data yang terikat dengan waktu (time-stamped). Time-series database dioptimalkan untuk menangani penulisan data (high write throughput) yang terus-menerus.

- Skalabilitas Horizontal: Data dari berbagai gudang di seluruh Indonesia akan sangat besar. Database seperti Cassandra memungkinkan distribusi data di banyak server tanpa adanya titik

kegagalan tunggal (no single point of failure).

- Query Berbasis Waktu: Memudahkan Andi untuk melihat tren suhu gudang atau fluktuasi stok dalam rentang waktu tertentu dengan performa yang tetap cepat.

Soal 2 dan 3

Post:

The screenshot shows a REST client interface with a POST request to `https://xxxvngrhujtktsrllws.supabase.co/rest/v1/products`. The request body is a JSON object with the following structure:

```
1 {
2   "name": "Ahmad Shofi",
3   "category": "SE0001",
4   "details": {
5     "NIM": "103122400024",
6     "roleTechManifest": "Backend, Flutter Developer",
7     "techStack": "Dart, Java, C++"
8   }
9 }
```

Get :

The screenshot shows the same REST client interface, but now displaying the response of the POST request. The status is 201 Created and the response body is a JSON array containing two objects. The first object is a partial response, and the second object is a full response with an ID and a created_at timestamp.

```
0 {
1   "roleTechManifest": "UI/UX, FrontEnd"
2 },
3 {
4   "id": "c62f912b-3e5c-4445-b461-893f124840b2",
5   "name": "Ahmad Shofi",
6   "category": "SE0001",
7   "details": {
8     "NIM": "103122400024",
9     "techStack": "Dart, Java, C++",
10    "roleTechManifest": "Backend, Flutter Developer"
11  },
12  "created_at": "2026-05-22T10:15:30.123456+00:00"
13 },
14 ]
15 }
```
